

React

Vite (pronounced “veet”, like *wheat*) is a modern frontend build tool that makes web development super fast, especially with React, Vue, and vanilla JS.

Think of it as:

a faster replacement for tools like CRA (Create React App) or old bundlers.

Vite = tool that helps you create, run, and build frontend apps very fast

Why Vite is so fast?

Traditional tools (like Webpack) first bundle the whole app, then start the server
Vite does not bundle during development.

Vite's secret sauce

1. Uses ES Modules (ESM) in the browser
2. Instant server start
3. Lightning-fast Hot Reload (HMR)

So when you change a file → only that file reloads ⚡

What problems does Vite solve?

1. Slow project startup
2. Slow reload after code change
3. Heavy configuration

Fast dev server

Simple setup

Faster builds

npm create vite@latest write this command in your terminal

npm run dev

when you work on company if you don't understand anything related to project go to package.json where all the information present there you see script and dependencies

npm init se aata h package.json

then npm install react

then npm install react-dom

ab aap chate ho aapka parcel dev dependencies se aaye to aap simple likha

npm install -D parcel vo production me nhi jayega

npx parcel index.html jb reander krana ho chizo ko
